ABSTRACT

A computer program is presented for the analysis of compressible fluid flow across a sealing dam, such as is used in a shaft seal. The mathematical model consists of two closely spaced parallel rings, one of which is rotating. The analysis is restricted to steady, laminar, subsonic, isothermal flow. The effect of rotation on mass flow, pressure distribution, and other physical parameters is determined. The computer program is written in FORTRAN IV. The input and output variables are in English units; printout of data in the International System of units is optional.

INVESTIGATION OF ISOTHERMAL, COMPRESSIBLE FLOW ACROSS A ROTATING SEALING DAM

II - COMPUTER PROGRAM

by John Zuk, Patricia J. Smith, and Lawrence P. Ludwig

Lewis Research Center

SUMMARY

A computer program is presented for steady, laminar, subsonic, isothermal, compressible-fluid flow across a sealing dam of a radial shaft seal. Output variables include mass flow, volume flow, exit Mach number, rotational flow Reynolds number, pressure flow Reynolds number, Knudsen number, center of pressure, sealing dam force, pressure distribution, power loss, and approximate temperature rise of the gas leaking through the seal. The computer program is written in FORTRAN IV for the computer at Lewis Research Center, which is an IBM 7094II/7044 or 7040 direct couple computer under IBSYS version 13 using ALTIO. All input, output, and calculations are in English units; printout of data in the International System of units is optional. The program flow charts are presented in detail and a sample problem is given.

INTRODUCTION

In a companion paper (ref. 1), the analysis is given for the mass flow and pressure distribution for a parallel set of surfaces typical of that in the sealing dam of shaft face seals (ref. 2). The analysis is for steady, laminar, subsonic, isothermal, compressible-fluid flow with rotation of one of the sealing dam surfaces. Mass flow and pressure distribution with rotation are compared with the hydrostatic case. Reference 1 shows that rotation has significant effects when the speed is high or the radial pressure differential across the sealing dam is very small and the speed is moderate. When the sealing dam radius is much greater than the sealing dam width, which, in turn, is much greater than the film thickness, and the radial pressure flow is sufficiently large, a hydrostatic analysis is shown to be valid. Further, in the analysis presented in reference 1, the region of validity of the analysis is defined as follows:

the diagram. Since typical values of the sealing gap are less than 0.0010 inch (0.0025 cm), the gap is, in effect, a long narrow slot, and viscous forces are predominant in leakage analysis. The model that approximates this sealing dam is shown in figure 2. It consists of two parallel, concentric circular rings, separated by a very narrow gap, with one moving at a constant speed. A pressure differential exists between

Figure 2. - Model of sealing dam.

the inner and outer diameter of the rings, and the fluid is stagnant in the inner and outer cavities that bound the sealing dam. The model formulation is based on the following restrictions:

- (1) Homogeneous, compressible, viscous, and Newtonian fluid
- (2) Steady and laminar flow with negligible inertia forces
- (3) Bulk modulus, $\lambda = -\frac{2}{3}\mu$ (Symbols are defined in appendix A.)
- (4) Perfect gas fluid
- (5) Negligible entrance region effects
- (6) Isothermal fluid film
- (7) Entrance Mach number, close to zero

Sealing Dam Analysis

The governing flow equations for a compressible fluid with constant viscosity in vector notation are as follows (ref. 3):

Conservation of mass

$$\frac{D\rho}{Dt} + \rho \vec{\nabla} \cdot \vec{V} = 0$$

Conservation of momentum (Navier-Stokes equation)

$$\rho \frac{D\vec{V}}{Dt} = \vec{\nabla} P - \mu \vec{\nabla} \times (\vec{\nabla} \times \vec{V}) + (\lambda + 2\mu) \vec{\nabla} (\vec{\nabla} \cdot \vec{V}) + \vec{F}$$

Equation of state for an isothermal process

$$P = P(\rho)$$

In reference 1 the governing flow equations are applied to the sealing dam model, simplified, and solved by

- (1) Utilizing a cylindrical coordinate system (see fig. 2)
- (2) Simplifying the governing equations by using the restrictions listed for the sealing dam model
- (3) Applying the appropriate boundary conditions.

The resulting equations are shown in table I in the form used in the computer program.

The equations of table I are in the English system of units, and table II shows the conversions to SI units. The computer calculations are carried out in the English system of units, but the program contains provision for printout in SI units.

TABLE I. - FORM OF PERTINENT EQUATIONS FOUND IN COMPUTER PROGRAM
(IN SAME SEQUENCE AS EQUATIONS APPEAR IN PROGRAM)

$A = \pi (R_2^2 - R_1^2), \text{ in.}^2$	$Re(P) = \frac{P_{\min} U_{av}^{2h} (12 \text{ in.}/ft)}{(32.174 \frac{\text{lbm-ft}}{\text{lbf-sec}^2})^\mu R(T + 460)} = Re_{2h}$
$R = \frac{R}{m}, \frac{\text{ft-lbf}}{\text{lbm}^\circ R} \text{ where } R = 1545.4 \frac{\text{ft-lbf}}{(\text{lb-mole})^\circ R}$	$Q = 13.083 \dot{M}, \text{ scfm}$
$\rho_1 = \frac{P_1 (144 \text{ in.}^2/ft^2)}{R(T + 460) (32.174 \frac{\text{lbm-ft}}{\text{lbf-sec}^2})} \frac{\text{lbf-sec}^2}{ft^4}$	$Power = \frac{\mu A V^2}{h} \left(\frac{1 \text{ hp}}{550 \frac{\text{ft-lb}}{\text{sec}}} \right) \left(\frac{1}{12 \frac{\text{in.}}{ft}} \right), \text{ hp}$
$a = \sqrt{\gamma R(T + 460) \left(32.174 \frac{\text{lbm-ft}}{\text{lbf-sec}^2} \right)}, \text{ ft/sec}$	$\Delta T = \frac{(42.42 \frac{\text{lbf-min}}{\text{hp}} (Power))}{\dot{M} C_p}, ^\circ F$
If $L = 0, L = 2\pi \frac{(R_1 + R_2)}{2}, \text{ in.}$	$H_{TOT} = 42.42 (Power), \text{ Btu/min}$
If $\rho_0 = 0, \rho_0 = \rho_1, \text{ lbf-sec}^2/ft^4$	$F = L \int_0^{R_2-R_1} (P - P_{\min}) dx, \text{ lbf}$
If $N \neq 0, V = \frac{2\pi N}{(12 \text{ in.}/ft)} \left(\frac{R_1 + R_2}{2} \right) \left(\frac{\text{min}}{60 \text{ sec}} \right), \text{ ft/sec}$	$X_c = \frac{L}{F} \int_0^{R_2-R_1} (P - P_{\min}) x dx, \text{ in.}$
If $N = 0$ and if $V = 0$, then $\Delta T = 0, ^\circ R$ $C_p = 0, \text{ Btu/lbm}^\circ R$	$x = x_1 + n\Delta x, \text{ in.}$
$\Omega = 2\pi N, \text{ rad/min}$	$P(x) = \left\{ \exp \left[-\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right] \left[\frac{P_2^2 \exp \left(\frac{K_1}{2} \right) - P_1^2 \exp \left(\frac{K_1 R_1^2}{2R_2^2} \right)}{\int_0^{R_2-R_1} \exp \left[\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right] dx} \right] \right. \\ \left. \times \int_0^x \exp \left[\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right] dx + P_1^2 \exp \left(\frac{K_1 R_1^2}{2R_2^2} \right) \right\}^{1/2}$
$Re(R) = \rho_0 \left(\frac{R_2 + R_1}{2} \right) \frac{\Omega}{\mu (60 \text{ sec/min}) (144 \text{ in.}^2/ft^2)}$	where $K_1 = -\frac{3R_2^2 \Omega^2}{5RT}$
$\Delta X = \frac{R_2 - R_1}{(\text{number of steps})}, \text{ in.}$	$\bar{F} = \frac{F}{ P_1 - P_2 (R_2 - R_1)L}$
$\dot{M} = 1.93 \times 10^3 h^3 \rho_1 \left\{ P_1^2 - P_2^2 \exp \left[-\frac{K_1}{2} \left(\frac{R_1^2}{R_2^2} - 1 \right) \right] \right\} \exp \left(\frac{K_1}{2} \frac{R_1^2}{R_2^2} \right)$ $\mu P_1 \int_0^{R_2-R_1} \exp \left[\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right] dx$	$\bar{X}_c = \frac{X_c}{(R_2 - R_1)}$
where $K_1 = -\frac{3}{5} \frac{R_2^2 \Omega^2}{RT}$	$Torque = \frac{(33\ 000) (Power)}{N} \left(\frac{12 \text{ in.}}{ft} \right), \text{ ft-lbf}$
$U_{av}(x) = \frac{(144 \text{ in.}^2/ft^2)}{(32.174 \frac{\text{lbm-ft}}{\text{lbf-sec}^2})} \frac{\dot{M} P_1}{L \rho_1 h_1 P(x)}, \text{ ft/sec}$	
$M = \frac{U_{av}}{a}$

Also included are lists of the input variables and program variables along with their descriptions and English units, detailed descriptions of the subprograms, and a flow chart of the main program (fig. 3). (Listings of the programs are given in appendix B; the sample problem, with output options, appears in appendix C.)

Description of Program

RSEAL - Main Program. - The main program, RSEAL, performs the primary flow analysis. Subroutines are used for secondary operations such as numerical integrations and plotting data. Input to RSEAL is by punched cards in the following order:

- (1) Title card: alphanumeric identification of the data (format 12A6)
- (2) NJ card: number of film thicknesses to be analyzed in one running of the program (format I3)
- (3) Film thickness, h_m , cards: 6 per card (format 6F12.0)
- (4) Data cards: seal dimensions, operating conditions, physical properties of gas and logical variables (read by NAMELIST/RINPT/)

Data are read by NAMELIST to minimize the number of cards required to run a second case with the same title and h_m cards. Input variables are set of zero initially.

Consequently, variables that are not changed during the reading of data will be calculated by the program. (See the list of input variables for the significance of each variable and any restrictions on them.)

Output data are printed in English units in the following order of groups:

- (1) Program identification: compressible sealing dam with rotation and parallel surfaces
- (2) Data identification: printout of title card
- (3) Input data as it appears on RINPT cards
- (4) Calculated constants: gas constant, reference density, speed of sound, length of seal, area of seal
- (5) Parameters that vary with h_m : mass flow rate, volume flow rate at standard conditions, maximum Mach number, pressure flow Reynolds number, rotational flow Reynolds number, sealing dam force, center of pressure, dimensionless sealing dam force, dimensionless center of pressure, and Knudsen number. (Printout of dimensionless sealing dam force and center pressure may be skipped by setting RSKIP to TRUE.)
- (6) Parameters associated with power dissipation: power, total shear heat, apparent temperature rise, and torque. (Printout of all data associated with power dissipation may be skipped by setting TSKIP to TRUE.)
- (7) Distribution of parameters across the sealing dam (one group for each h_m): distance across seal, pressure, pressure ratio, average velocity, and Mach number.

Printout of data in English units is followed by plots of various parameters. Plots appear in standard form with minimum X and minimum Y in the lower left-hand corner. Legends at the bottom of the plots give conversion factors for SI units. The plots are as follows:

- (1) Power versus h_m for $N \neq 0$
- (2) Pressure ratio versus distance across seal for first case for which the model is valid. Plot 2 may be suppressed by setting ASKIP to TRUE.

Following the plots, the data are printed in SI units in the same order as for English units. This printout may be skipped entirely by setting NOUI to TRUE.

RSEAL is divided roughly into eight sections. The first section reads data and calculates program constants (cards 41 to 56).

Section two (cards 82 to 87) calculates the constants needed in the pressure equation.

Section three (cards 93 to 105) tests input variables. If they are zero, new values for them are calculated. Since SPEED and CAPV both represent rotational velocity, they must be consistent. If SPEED is read as nonzero, CAPV is calculated from SPEED. If SPEED is read as zero, CAPV must be examined. In the case that CAPV is nonzero, SPEED is calculated from CAPV. If both SPEED and CAPV are zero, the system considered is static.

Section four (cards 111 to 139) is the first part of a loop which is done for each h_m . This section calculates a starting value for X , mass flow rate, volume flow rate at standard pressure condition, pressure flow Reynolds number, rotational flow Reynolds number, maximum Mach number, and Knudsen number. If the maximum Mach number is greater than $1/\sqrt{\gamma}$, this analysis is no longer valid, IHTAG(J) is set equal to 1 as a trigger, and no further calculations are made. If the model remains valid, the program calculates power, temperature rise due to power dissipation, total shear heat, sealing dam force, and center of pressure. The integrations in the force and center of pressure equations are done numerically by Simpson's Rule.

Section five (cards 144 to 154) is the rest of the loop started in section three. Section five calculates pressure, pressure ratio, average velocity, and Mach number for several points across the sealing dam.

Section six (cards 158 to 200) writes data in English units. Section seven (cards 204 to 233) plots the various parameters. And section eight (cards 237 to 295) writes data in SI units.

Numerical constants in the program are for units conversion.

Subprograms. - RSEAL uses eight subprograms whose listings appear in appendix B. These are SIMPS1, SIMPS2, PX, PXX, PRESS, ROT, EXPK, and ARRNG. RSEAL also uses two other subroutines that are not standard in IBSYS: SORTXY and PLOTXY.

SORTXY sorts two numerical arrays. A statement such as CALL SORTXY (X, Y, N) results in the array X being rearranged such that $X(1) \leq X(2) \leq \dots \leq X(N)$ with the Y array entries reordered to preserve the (X, Y) pairs. N is the number of elements in the X and Y arrays.

PLOTXY plots two numerical arrays. A statement such as CALL PLOTXY (X, Y, KODE, P) produces a printer plot of X versus Y with the minimum X and the minimum Y in the upper left corner of the page with X increasing down the page and Y increasing across the page. KODE tells which plotting options are to be used. For example, KODE = 6 gives a plot with most of the grid lines suppressed, with asterisks as the plotting character, and with the X and Y scales computed by the plotting routine. The array P contains information needed by the plotting routine such as the number of points to be plotted, the X and Y scales if the programmer computes them, and the frequency of grid lines in the X and Y directions.

Special format statements are used to print plot titles and plot legends. A pair of statements such as

```
WRITE (6, 1)
1 FORMAT (2HPT, 10HPLOT TITLE)
```

will print the title

PLOT TITLE

above the plot. A pair of statements such as

```
WRITE (6, 2)
2 FORMAT (2HPL, 11HPLOT LEGEND)
```

will print the legend

PLOT LEGEND

immediately below the plot.

Listings of SORTXY AND PLOTXY along with details for their use can be found in reference 4 or can be obtained from the Instrument and Computing Division of the Lewis Research Center.

SIMPS1 is a function subprogram to perform a numerical integration by Simpson's Rule. The integrand is evaluated at interior points by the external function named in the calling vector. A statement such as $F = \text{SIMPS1} (XO, XF, G, K)$ gives F as the definite integral

$$\int_{XO}^{XF} G(X) dX$$

The integrand is evaluated at interior points by the function G named in the calling vector. The interval of integration XO to XF is not divided uniformly. More subdivisions are made where values of the integrand are changing rapidly. If two successive evaluations of the integral on a particular subinterval differ by more than $3 \times 10^{-5} \times$ value of the integrand, the subinterval is divided into two subintervals and the integration is repeated. If the integration required more than 200 subintervals, the integer K is raised by 1 to indicate that the value of the integral is incorrect.

SIMPS2 performs essentially the same operation as SIMPS1, but it permits carrying a constant parameter into the integration by means of the calling vector. A statement such as $F = \text{SIMPS2} (A, XO, XF, G, KK)$ gives F as the indefinite integral

$$\int_{XO}^{XF} G(A, X) dX$$

Use of SIMPS2 permits evaluating double integrals because the external function G can call SIMPS1 to evaluate the inner integral. KK performs the same function as K , but KK is raised by 2 to indicate inaccuracies in the integration. Subprograms SIMPS1 and SIMPS2 are in general use at the Lewis Research Center.

PRESS is a function subprogram to evaluate the pressure at any distance from the inner radius of the seal. This distance appears in the calling vector. The pressure differential equation is solved analytically and the resulting formula is used in the program.

$$P(x) = \left\{ \exp \frac{-K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \left[\frac{P_2^2 \exp \left(\frac{K_1}{2} \right) - P_1^2 \exp \left(\frac{K_1 R_1^2}{2 R_2^2} \right)}{\int_0^{R_2 - R_1} \frac{\exp \left[\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right]}{x + R_1} dx} \int_0^x \frac{\exp \left[\frac{K_1}{2} \left(\frac{x + R_1}{R_2} \right)^2 \right]}{x + R_1} dx + P_1^2 \exp \left(\frac{K_1 R_1^2}{2 R_2^2} \right) \right] \right\}^{1/2}$$

where PX is an external function to evaluate the integrand in the integral

$$\frac{F}{L} = \int_0^{R_2 - R_1} (P - P_{\min}) dx$$

Similarly, PXX is an external function to evaluate the integrand in the integral

$$X_c = \frac{L}{F} \int_0^{R_2 - R_1} (P - P_{\min}) x dx$$

where P_{\min} is the smaller of P_1 and P_2 .

EXPK is a function subprogram to evaluate $\exp(K_1 x) / (2 R_2^2)$ where x appears in the calling vector.

ROT is an external function to evaluate the integrand in the integral

$$\int_0^X \frac{\exp \left[\frac{K_1 (x + R_1)^2}{2R_2^2} \right]}{x + R_1} dx$$

ARRNG is a subroutine subprogram which arranges two arrays X and Y for plotting. The subroutine first eliminates cases for which the model does not remain valid. It then sorts the remaining data in order of ascending X. It then inverts both arrays and interchanges them. The data are now in the form of ordered pairs (Y(N), X(N)), (Y(N - 1), X(N - 1)), . . . , (Y(1), X(1)) where $Y(N) \geq Y(N - 1) \geq \dots \geq Y(1)$. Data arranged in this form permit plotting with Y as the independent variable in descending order. Consequently, the plots appear with the minimum X and minimum Y in the lower left corner.

Input Variables

The following table lists variables input to the program and their units. Arrays are given with their dimensions.

Variable	Unit	Description
TITLE (12)		Data identification
NJ		Number of mean film thicknesses ($NJ \leq 50$)
HMEAN(J), ←J=1, ←NJ	in.	Mean film thicknesses
L	in.	Width or mean circumference of sealing dam of flow
SPEED	rpm	Rotational speed. Either SPEED or CAPV may be set. If both are set, calculate CAPV from SPEED
CAPV	ft/sec	Surface speed.
MOLWT	lbm/(lb-mole)	Molecular weight of the gas
P1	psi	Pressure at inner radius of seal
P2	psi	Pressure at outer radius of seal
T	°F	Isothermal reference temperature

Variable	Unit	Description
R1	in.	Inner radius of seal
R2	in.	Outer radius of seal
RHORO	lbf-sec ² /ft ⁴	Reference density at inner radius of the seal. If RHORO is read as zero, program calculates RHORO.
RHORF	lbf-sec ² /ft ⁴	Density at mean radius used in calculating the rotational Reynolds number. If RHORF is read as zero, the program calculates RHORF.
MU	lbf-sec/ft ²	Absolute viscosity of gas
CP	Btu/lbm-°R	Specific heat of gas
GAMMA		Ratio of specific heats
NGRID		Number of steps across seal (max = 20)
ASKIP		Logical variable. If ASKIP = TRUE, program skips calculation and printout of x, pressure, average velocity, Mach number, and pressure ratio. It also skips plotting of x versus pressure ratio.
RSKIP		Logical variable. If RSKIP = TRUE, program skips calculation and printout of dimensionless center of pressure and force. It also skips plotting of dimensionless F.
TSKIP		Logical variable. If TSKIP = TRUE, program skips calculation, printout, and plotting of power.
NOUI		Logical variable. If NOUI = TRUE, program makes no conversion to SI units.

Program Variables

The following table lists the variables used in the program in the approximate order of their appearance, any limitations on the variables, and their units. Variables marked with an asterisk are printed as output data.

PI		$\pi = 3.1415927$
RUNIV	ft-lbf/(lb-mole) ^{°R}	Universal gas constant

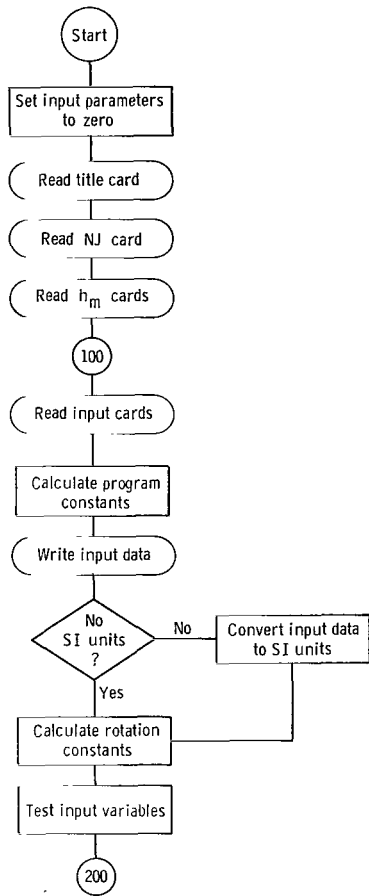

Variable	Unit	Description
ZERO		Input variables are set to 0.
PREF	psi	Smaller of P1 and P2 in the COMMON block
RR1	in.	Value of R1 in the COMMON block
MCUT		$1/\sqrt{\gamma}$ = upper limit for which model is valid
NN		Number of grid points ($1 \leq NN \leq 21$)
JMOD		Integer number of pressure distributions that will fit on one page.
RDIF	in.	Distance across seal = R2-R1
PDIF	psi	Total pressure drop across seal
AREA*	in. ²	Face surface area of seal
R*	lbf-ft/lbm-°R	Gas constant
RHO1*	lbf-sec ² /ft ⁴	Density at inner radius of seal
A*	ft/sec	Speed of sound
RHOREF*	lbf-sec ² /ft ⁴	Calculated density at mean radius of seal
OMEGA	rad/min	Rotational velocity
ECONST	1/in. ²	$-K_1/2R_2^2$ (where K_1 is defined in appendix A)
EA	lbf ² /in. ⁴	$P_1^2 \exp \frac{K_1}{2} \left(\frac{R_1}{R_2} \right)^2$
AA	lbf ² /in. ⁴	$P_2^2 \exp \frac{K_1}{2} - P_1^2 \exp \frac{K_1}{2} \left(\frac{R_1}{R_2} \right)^2$
S		$\int_0^{R_2-R_1} \frac{\exp \left[\frac{K_1}{2} \left(\frac{X+R_1}{R_2} \right)^2 \right]}{X+R_1} dX$
DELX	in.	Distance between two successive grid points
X(J, I)*	in.	Distance from inner radius of seal
MDOT(J)*	lbm/min	Mass flow rate
VAV	ft/sec	Average velocity at outer radius of seal
MACHMX(J)*		Maximum Mach number for given HMEAN
REP(J)*		Pressure flow Reynolds number

Variable	Unit	Description
RER(J)*		Rotational flow Reynolds number
Q(J)*	scfm	Volume flow rate at standard conditions
KN(50)*		Knudsen number
IHTAG(J)		Numerical flag IHTAG(J) = 0 implies model remains valid IHTAG(J) \neq 0 implies model is invalid
POWER(J)*	hp	Power dissipated by viscous shearing
DEL TJ(J)*	$^{\circ}\text{F}$	Apparent temperature rise due to power dissipation
TORQUE(J)*	lbf-ft	Torque
HTOTAL(J)*	Btu/min	Total shear heat of system
F(J)*	lbf	Equivalent force
XC(J)*	in.	Center of pressure
K, KK		Numerical flags that indicate whether the numerical integrations in the calculation of F(J) and XC(J) are accurate
P(J, I)*	psi	Pressure at X(J, I)
PRAT(J, I)*		Ratio of P to P_{\min} at X(J, I)
UAVRG(J, I)*	ft/sec	Average velocity at X(J, I)
MACH(J, I)*		Mach number at X(J, I)
FBAR(J)*		Dimensionless force
XCBAR(J)*		Dimensionless center of pressure
JJ		Counter for valid cases. If JJ = 1 modulo JMOD, the printer will skip to a new page.
XPT(50), YPT(50), XPLOT(50), YPLOT(50) } PP(61)		Utility arrays used in sorting and plotting data Array needed by plotting subroutine - see description of PLOTXY for details
KODE		Plotting code - see description of PLOTXY for details
NP		Number of points in a plot ($1 \leq \text{NP} \leq 50$)
I		X index
J		HMEAN index

Subroutines

Name	Call vector variables	Common block variables	Program variables	Description

APPENDIX A

SYMBOLS

A	cross-sectional area, in. ² ; m ²	Q	net volume flow rate, scfm; std. m ³ /sec
a	speed of sound, ft/sec; m/sec	\bar{R}	mean radius, (R ₁ + R ₂)/2, in.; m
C _p	specific heat at constant pressure, Btu/(lbm)(°R); J/(kg)(K)	ΔR	sealing dam length, R ₂ - R ₁ , in.; m
C _v	specific heat at constant volume, Btu/(lbm)(°R); J/(kg)(K)	Re _h	Reynolds number in radial direc- tion, ρUh/μ
D/Dt	material derivative, $\frac{\partial}{\partial t} + u \frac{\partial}{\partial r} + \frac{v}{r} \frac{\partial}{\partial \theta} + w \frac{\partial}{\partial z}$	Re _r	Reynolds number in circumferen- tial direction, $\rho \bar{R} \Omega h / \mu$
F	sealing dam force, lbf; N	ℜ	gas constant, ℜ/m, ft-lbf/(lbm)(°R); J/(kg)(K)
\bar{F}	dimensionless force, F/(P ₂ - P ₁)(R ₂ - R ₁)L	$\bar{\mathcal{R}}$	universal gas constant, 1545.4 ft-lbf/(lb-mole)(°R); 8.3143 J/(kg-mole)(K)
\vec{F}	body force vector	r	radial direction coordinate
h	film thickness, nominal, in.; m	T	temperature, °F; K
K ₁	-(3R ₂ ² Ω ² /5ℜT)	\bar{T}	average temperature, °F, K
L	sealing dam width, in.; m	U	pressure-flow reference velocity, ft/sec; m/sec
M	Mach number	u	velocity in r-direction or x-direction, ft/sec; m/sec
\dot{M}	mass flow, lbm/min; kg/sec	V	reference shear flow velocity, ft/sec; m/sec
Δ \dot{M}	change in mass flow	v	velocity in θ-direction, ft/sec; m/sec
m	molecular weight of gas, lbm/(lb-mole); kg/kg-mole	w	velocity in y-direction, ft/sec; m/sec
N	speed of rotation, rpm	W	reference velocity across film thickness, U(h/ΔR), ft/sec; m/sec
n	integer		
P	static pressure, psi; N/m ²		
ΔP	pressure differential, psi; N/m ²		
P _{min}	smaller pressure of two pressure boundary conditions, psi; N/m ²		

X_c	center of pressure in radial or x-direction, in. ; m	ρ	density, (lbf)(sec ²)/ft ² ; kg/m ³
\overline{X}_c	dimensionless center of pressure, $X_c/(R_2 - R_1)$	Ω	angular rotational velocity, rad/sec
x	coordinate in pressure gradient direction	∇	Del operator, $\frac{\partial}{\partial r} \hat{i} + \frac{1}{r} \frac{\partial}{\partial \theta} \hat{j} + \frac{\partial}{\partial z} \hat{k}$
y	coordinate across film thickness	Subscripts:	
z	shear flow coordinate in Cartesian system	av	average
γ	specific-heat ratio, C_p/C_v	h	based on film thickness
θ	circumferential coordinate	m	mean
λ	second viscosity coefficient or coefficient of bulk viscosity	r	based on radius
μ	absolute or dynamic viscosity, (lbf)(sec)/ft ² ; (N)(sec)/m ²	ref	reference
ν	kinematic viscosity, ft ² /sec; m ² /sec	0	reference
		1	inner radius or inlet
		2	outer radius or exit

APPENDIX C

SAMPLE PROBLEM

An example of the use of the computer program will now be given with the following conditions: Air at 45.0 psia is to be sealed from ambient air at 15.0 psia using a seal operating in the externally pressurized mode. The mean temperature is 100° F. The sealing dam outside diameter is 6.630 inches, inside diameter is 6.530 inches, and the design speed is 2795 rpm.

It is desired to find a design mean film thickness which is large enough so that power dissipation and viscous heating temperature rise are sufficiently low, yet small enough so that the mass leakage is tolerable. From our experience, the best method is to try mean film thickness inputs of 0.1 to 1.0 mil in increments of 0.1 mil. The output desired is the mass and volume flow rates, sealing dam force due to the pressure drop, center of pressure, power loss, and approximate temperature rise due to shearing. A check on the validity of the analysis is made by examining the Mach number, Knudsen number, and rotational and pressure flow Reynolds numbers. Thus the program input will include

Speed of rotation, N, rpm	2796
Molecular weight of gas, m, lbm/(lb-mole)	28.9660
Pressure at inner radius or inlet, P_1 , psia	15.0
Pressure at outer radius or exit, P_2 , psia	45.0
Absolute or dynamic viscosity, μ , lbf-sec/ft ²	3.06×10^{-7}
Specific heat at constant pressure, C_p , Btu/lbm-°R	0.24
Mean film thickness (increase in increments of 0.1), h_m , mil	0.1 to 1.0
Temperature, T, °F	100
Inner radius, R_1 , in.	3.265
Outer radius, R_2 , in.	3.315
Specific heat ratio, γ	1.4

The data sheet for this sample problem is shown in table III. The sample output, with all possible output options are shown in both English and SI units. Note that the analysis is invalid for film thicknesses greater than 0.5 mil (where the Mach number has exceeded $1/\sqrt{\gamma} = 0.845$). The pressure and velocity distributions, torque, and plots of pressure and power versus mean film thickness are included for a more detailed examination of this problem. This problem ran in approximately 0.1 minute on the Lewis computer.

PLOT OF POWER VS H(MEAN)

POWER ON VERTICAL SCALE - H(MEAN) ON HORIZONTAL SCALE

POWER IN HORSE POWER - TO CONVERT TO WATTS, MULTIPLY BY 745.7

H(MEAN) IN INCHES - TO CONVERT TO METERS, MULTIPLY BY 2.54E-2

FOR SHEAR HEAT IN BTU/MIN, MULTIPLY POWER BY 42.42

PLOT OF P/P(MIN) VS X FOR $\mu(\text{MEAN}) = 0.50000\text{E-}03$

P/P(MIN) ON VERTICAL SCALE - X ON HORIZONTAL SCALE

P/P(MIN) IS DIMENSIONLESS

X IN INCHES - TO CONVERT TO METERS, MULTIPLY BY $2.54\text{E-}2$

COMPRESSIBLE SEALING DAM WITH ROTATION AND PARALLEL SURFACES

Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

— NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Notes, and Technology Surveys.

Details on the availability of these publications may be obtained from:
